1 Acknowledged

Centralization findings highlight privileged roles & functions and their capabilities, or instances where the project takes custody of users' assets.

0 Critical

Critical risks are those that impact the safe functioning of a platform and must be addressed before launch. Users should not invest in any project with outstanding critical risks.

0 Major

Major risks may include logical errors that, under specific circumstances, could result in fund losses or loss of project control.

0 Medium

Medium risks may not pose a direct risk to users' funds, but they can affect the overall functioning of a platform.

0 Minor

Minor risks can be any of the above, but on a smaller scale. They generally do not compromise the overall integrity of the project, but they may be less efficient than other solutions.

0 Informational

Informational errors are often recommendations to improve the style of the code or certain operations to fall within industry best practices. They usually do not affect the overall functioning of the code.

APPROACH & METHODS | APM FASHION - AUDIT

This audit was conducted for apm to evaluate the security and correctness of the smart contracts associated with the apM Fashion - audit project. The assessment included a comprehensive review of the in-scope smart contracts. The audit was performed using a combination of Manual Review and Static Analysis.

The review process emphasized the following areas:

- Architecture review and threat modeling to understand systemic risks and identify design-level flaws.
- Identification of vulnerabilities through both common and edge-case attack vectors.
- Manual verification of contract logic to ensure alignment with intended design and business requirements.
- Dynamic testing to validate runtime behavior and assess execution risks.
- Assessment of code quality and maintainability, including adherence to current best practices and industry standards.

The audit resulted in findings categorized across multiple severity levels, from informational to critical. To enhance the project's security and long-term robustness, we recommend addressing the identified issues and considering the following general improvements:

- Improve code readability and maintainability by adopting a clean architectural pattern and modular design.
- Strengthen testing coverage, including unit and integration tests for key functionalities and edge cases.
- Maintain meaningful inline comments and documentations.
- Implement clear and transparent documentation for privileged roles and sensitive protocol operations.
- Regularly review and simulate contract behavior against newly emerging attack vectors.

REVIEW NOTES | APM FASHION - AUDIT

Overview

APM Token is a standard ERC-20 token built on OpenZeppelin's `ERC20` implementation, with ERC-2612 permit support via `ERC20Permit`. The token is deployed with the name `apM Fashion` and the symbol `APM`. At deployment, the constructor mints the entire fixed supply of `10,000,000,000 APM` to the provided `recipients` list according to the corresponding `amounts`, requiring the minted total to equal `TOTAL_SUPPLY`.

External Dependencies

The current codebase relies on a small set of external contracts and external-system interfaces to implement its business logic.

The following third-party or external dependency contracts/interfaces are used in the reviewed code:

- `@openzeppelin/*`

It is assumed that these dependencies are trusted and implemented correctly.

Informational

This report has been prepared for apm to identify potential vulnerabilities and security issues within the reviewed codebase. During the course of the audit, a total of 1 issue was identified. Leveraging a combination of Manual Review & Static Analysis the following findings were uncovered:

ID	Title	Category	Severity	Status

APA-01 | Initial Token Distribution

Category	Severity	Location	Status
Centralization	● Centralization	contracts/ApmFashion.sol: 22	● Acknowledged

Description

All of the 10_000_000_000 **APM** tokens are sent to the contract deployer or one or several externally-owned account (EOA) addresses. This is a centralization risk because the deployer or the owner(s) of the EOAs can distribute tokens without obtaining the consensus of the community. Any compromise to these addresses may allow a hacker to steal and sell tokens on the market, resulting in severe damage to the project.

Recommendation

It is recommended that the team be transparent regarding the initial token distribution process. The token distribution plan should be published in a public location that the community can access. The team should make efforts to restrict access to the private keys of the deployer account or EOAs. A multi-signature (2/3, 3/5) wallet can be used to prevent a single point of failure due to a private key compromise. Additionally, the team can lock up a portion of tokens, release them with a vesting schedule for long-term success, and deanonymize the project team with a third-party KYC provider to create greater accountability.

Alleviation

[apm, 07/03/2026]: After TGE and mainnet deployment, we will share the contract address and multisig configuration so the finding can be updated to Multisig.

[CertiK, 07/03/2026]: It is suggested to implement the aforementioned methods to avoid centralized failure. Also, CertiK strongly encourages the project team to periodically revisit the private key security management of all addresses related to centralized roles.

After the team deploys the token contract, please let us know the multisig address and transaction hash. We'll update the finding status once we have that information.
